## SPRINT 3

# **SENDGRID INTEGRATION WITH PYTHON**

DATE	03 NOVEMBER 2022
TEAM ID	PNT2022TMID25087
PROJECT NAME	NUTRITION ASSISTANT APPLICATION

### STEP 1:

REQUIREMENTS:

Python 2.6, 2.7, 3.4 or 3.5.

## **STEP 2:**

Create an API key

		Ready to send your first em	nail? Follow our guides for Email API or Marketing Campaigns. Let's doi!!!	
Ari Haran	۰	API Keys		Create API Key
		NAME	APIKEY	ACTION
Email API	v	ARI	A	© +
(G) Marketing	200

்ப் State	*			
Activity				
Suppressions	4			

#### **STEP 3:**

INSTALL PAKAGE: > pip installsendgrid

#### SETP 4:

#### SEND EMAIL

```
Co Uses) with Destrop SendGrid & demopy

| Gemopy | Gemop
```

#### **SENDGRID PYTHON CODE:**

```
import os
2 from sendgrid import SendGridAPIClient
3 from sendgrid.helpers.mail import Mail
4
5
  message = Mail (
6
       from email='from email@example.com',
7
       to_emails='to@example.com',
       subject='Sending with Twilio SendGrid is Fun',
8
       html content='<strong>and easy to do anywhere, even with
   Python</strong>')
10 try:
       sg = SendGridAPIClient(os.environ.get('SENDGRID API KEY'))
11
12
       response = sg.send(message)
13
       print (response.status_code)
14
      print (response body)
      print (response.headers)
16 except Exception as e:
      print (e.message)
```

## **HTTP CLIENT PROGRAM**

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
import urllib2 as urllib
      from urllib import urlencode
17 logger = logging.getLogger(__name_)
      def init (self, response):
          :param response: The return value from a open call
                           on a urllib.build opener()
          :type response: urllib response object
          self._status_code = response.getcode()
          self. body = response.read()
          self._headers = response.info()
          :return: integer, status code of API call
      def body (self):
         :return: response from the API
44
```

```

          :return: dict of response headers
          :return: dict of response from the API
          if self.body:
              return json.loads(self.body.decode('utf-8'))
65 class Client (object):
      methods = ('delete', 'get', 'patch', 'post', 'put')
                    host,
                    request headers=None,
                    url_path=None,
                    append slash=False,
                    timeout=None):
          :param host: Base URL for the api. (e.g.
  https://api.sendgrid.com)
          :type host: string
           :param request headers: A dictionary of the headers you want
```

```
applied on all calls
           :type request headers: dictionary
           :param version: The version number of the API.
                           Subclass build versioned url for custom
   behavior.
                           Or just pass the version as part of the URL
87
           :type version: integer
           :param url path: A list of the url path segments
           :type url path: list of strings
           self.host = host
           self.request headers = request headers or ()
           self. url path = url path or []
           self.append slash = append slash
           self.timeout = timeout
        def build versioned url(self, url):
103
               Or just pass the version as part of the URL
            :param url: URI portion of the full URL being requested
106
            :type url: string
107
            return '()/v()()'.format(self.host, str(self. version),
  url)
110
111
        def build url(self, query params):
112
113
114
            :param query params: A dictionary of all the query
```

```
:type query_params: dictionary
116
117
            url = ""
118
119
            while count < len(self. url path):
121
                url += '/()'.format(self._url_path[count])
123
124
            if self.append slash:
                url += 1/1
126
127
            query params:
                url_values = urlencode(sorted(query_params.items()),
130
131
132
133
                url = self. build versioned url(url)
134
135
136
137
138
        def update headers(self, request headers):
139
140
            :param request headers: headers to set for the API call
142
            :type request headers: dictionary
            :return: dictionary
144
145
            self.request headers.update(request headers)
146
147
```

```
149
            :param name: Name of the url segment
            :type name: string
            url path = self. url path + [name] if name else
                           request headers=self.request headers,
                           url path=url path,
                           append_slash=self.append_slash,
                           timeout=self.timeout)
        def _make_request(self, opener, request, timeout=None):
            :param opener:
            :type opener:
             :param request: url payload to request
            :type request: urllib.Request object
170
            :type timeout: float
172
             :return: urllib response
174
176
                return opener.open(request, timeout=timeout)
179
                 exc._cause_ = None
                 logger.debug('(method) Response: (status)
```

```
method=request.get method(),
                    status=exc.status code,
                    body=exc.body))
184
                raise exc
187
               (e.g. /your/api/{variable value}/call)
               Another example: if you have a Python reserved word,
190
               in your url, you must use this method.
            :param name: Name of the url segment
            :type name: string
194
195
196
            return self. build client (name)
197
       def getattr (self, name):
               (e.g. client.name.name.method())
               You can also add a version number by using
  .version(<int>)
            :param name: Name of the url segment or method call
204
            :type name: string or integer if name == version
            :return: mixed
               def get_version(*args, **kwargs):
210
                   :param args: dict of settings
211
                   :param kwargs: unused
```

```
213
214
                    self. version = args[0]
215
216
                return get_version
217
218
219
            if name in self.methods:
                method = name.upper()
221
                def http request (
223
                        request body=None,
224
                        query params=None,
                        request headers=None,
227
229
                    :param timeout: HTTP request timeout. Will be
  propagated to
                        urllib client
231
                    :type timeout: float
232
                    :param request headers: HTTP headers. Will be
 merged into
233
                        current client object state
234
                    :type request headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query params: dict
237
                    :param request body: HTTP request body
                    :type request body: string or json-serializable
238
239
                    :param kwargs:
240
241
242
                    1 request headers:
```

```
243
                        self. update headers (request headers)
244
                    If request body is None:
